InsightAI Company Overview

InsightAI is a fictional technology company used as a test fixture for the document-ingestion Spec (card T4). This PDF is not a real company document -- it exists solely to verify the upload, parsing, chunking, and metadata pipeline for PDF uploads, including per-page metadata propagation (Tech Review AD-9).

InsightAI builds an internal chatbot backed by a hybrid retrieval pipeline that combines BM25 keyword search with vector similarity search over 1024-dimension embeddings, then reranks the combined results before answering a question.

Page two of the InsightAI PDF fixture.

This second page exists so a test can assert that the chunk metadata builder propagates a non-null page number when Tika's parser reports one (AD-9's "Tika provides a page boundary" branch), as opposed to the plain-text/markdown fixtures in this same directory, which have no page concept and are expected to carry an explicit null page value instead.

The distinctive keyword for this fixture is InsightAI, repeated across both pages so a keyword-search test has something stable to look for.
